Intuitively create DITA content with an editor you'll enjoy.

Documentation made easy

Xeditor allows technical writers and occasional contributors to create DITA content intuitively and efficiently. The user-friendly interface leads authors through a defined document structure with real-time validation and easy collaboration. Our highly extensible framework ensures seamless integration with any CMS, enabling your content to be ready for use, re-use, and life in any format.

Full support for DITA 1.2

Xeditor fully supports all elements and attributes for the DITA 1.2 standard. The UI can be configured independently to ensure the best experience for your authors - all without any special knowledge of DITA or XML.

DITA maps

In Xeditor you may open and edit a map or individual topic. Map view allows for a drag and drop within a table of contents to add/remove content or change its position.

Intelligent real-time validation

During content creation Xeditor continually monitors and validates the XML structure. You can only execute actions that are valid and correct at the corresponding positions.

MathML formula editor

With the integrated WIRIS Formula Editor you can create mathematical formulas and complex expressions.

Web-based and location independent

Xeditor is entirely web-based and works with any modern browser. There is no software to install for the end-user and it may be accessed via the intranet/internet from any location.

Offline editing

You have the option to save documents without an internet connection and synchronize with the server as soon as the online connection is restored.

Change tracking and comments

All content modifications by you and other authors are independently tracked and can be analyzed for final editing. You can directly enter and save comments, remarks and corrections in the document without interrupting the text.

Spelling and Grammar

Using the integrated spelling check, texts are checked for spelling, grammar and style, ensuring error-free and uniform text quality.

Easy integration into existing systems

Xeditor's highly extensible JavaScript architecture allows for smooth integration into existing systems (CMS, PIM, DAM, etc.).
